Patch Sets (3/3) | Download

```
Add settings screen for global diff preferences

The account preferences are available under the Settings menu, but not
the diff preferences. The diff preferences are only accessible from
the diff screen by clicking on the gear icon. It's confusing to users
that they cannot find all preferences under the Settings menu. This is
why it makes sense to make the diff preferences available in the
Settings menu too.

There are a few diff settings which are only applicable when looking
at a concrete file diff and which are not stored on server side
(show/hide left side, language). These settings are not available when
the diff preferences are accessed from the Settings menu.

The diff preferences in the Settings menu are rendered with the same
style as the diff preferences in the popup. This makes it easy for
users to see that these are actually the same settings, just accessed
through different paths.
```

Well, with some overhead you could do everything, just create a side-by-side screen below of this window, render there some old/new and apply the change on that mini diff screen, embedded in my diff settings screen. Do we really want do that?
Consequently, you may argue, that Inine Editor preferences, that were separated recently from diff preferences also not exposed in my settings screen, and should be added on its own screen in My Inline Editor preferences. Again, with mini Inline Editor below the settings with sample content to try out the changes.

133
134         if ($frozen) {
```

Dave Liddament 11:02 AM

I think we might have to be slightly more sophisticated here. The only time we should validate component attributes is when we are 'freezing' the component. So this should be:

if (!$component->frozen && $frozen)

This stop us against doing validation on a frozen component and protects us against getting spurious validation errors (e.g. if a client doesn't bother to send back attributes when updating data that can be updated post freeze).

Reply Done

```
135             $componentTypeAttributes = $componentType->attributes;
136             $attributeValidator = new PropertyValidator($this->validatorFactory, $componentTypeAttributes);
137             $attributeValidator->with($payload)->validate();
138         }
139
140         $metadata = $payload['metadata'];
141
142         if (!$component->frozen) {
143             $component->name = $metadata['name'];
```
